CHRIS WHITTAKER

PROFILE

I am an electrical and computer engineering student, currently completing my final year of studies at the University of Cape Town. My ideal jobs involve design and development of embedded systems, security systems, and control and automation systems. I am pursuing internship opportunities in the field to further develop my career experience. I am a hardworking and dedicated individual, and I am eager to gain any valuable knowledge and insight that I can.

EDUCATION

King Edward VII School

I matriculated in 2022 with a Bachelor's pass and 6 distinctions. The subjects that I took were English, Afrikaans, Mathematics, Applied Mathematics, Physics, Biology, History, and Life Orientation. I played a variety of sports including rugby, rowing, and athletics.

University of Cape Town

I am currently completing my fourth and final year in Bsc. Eng. In Electrical and Computer Engineering. I passed first, second and third year with a greater than 70% aggregate and was awarded the Dean's Merit List award in all three years.

WORK EXPERIENCE

PCB design course tutor – University of Cape Town

April 2024–June 2024

In my second year of studies, I tutored a course based on PCB design in KiCad. This involved basics on how to use KiCad, as well as standards that need to be met for a PCB to be accepted for manufacturing. The course also involved content on the process in which PCBs are created.

Internship - Flying Robot

January 2025 – February 2025

Flying Robot builds and repairs drones and drone accessories. The work that I completed included soldering of surface mount PCB components, and the programming of a newly developed line of strobe-lights using an stm8 micro-controller and C programming language.

Internship – 5DT

June 2025 – July 2025

5DT is a company based in Pretoria that creates custom truck and other heavy vehicle simulators used to train drivers. My work there included some circuit board testing as well as research into the best microcontroller to use for an upgrade to one of their pieces of sensing equipment.

Vacation work Project – University of Cape Town

December 2025 – January 2026

This project involved building and testing a payment scheme that used blockchain technology and stable coins to transfer funds safely and efficiently. The work I did included development of the user interface (mobile app) as well as programming of the smartcards using the global platforms standards to write our custom applet to the card.

Internship – CAP Security

July 2026

While working at CAP I integrated an AI system with their fleet management software to make fetching and processing vital data simpler and quicker. I was exposed to the business side of a project, where I met with stakeholders, such as the HODs and CEO, to understand what they required from the AI reporting system. I also worked with the physical dashcam units and created a tutorial video to train non-technical staff on how to configure the settings on new dashcams.

SKILLS

- *Programming in Java, C, Native React, and Python*
- *Proficiency in the use of Solidworks software for 3D mechanical component design*
- *Proficiency in the use of Kicad software for PCB design.*
- *Embedded systems programming*
- *Design of Control Systems*
